Scar Management - ECAB Jan 18 2022 A number of scar revision techniques can be utilized to treat specific types of scars, in

combination with each other or with adjunctive therapies to achieve optimal results. Pathological conditions like hypertrophic scars and keloids are still challenging. Though a number of therapies exist to treat keloids, such as intralesional steroids and anti-metabolites, cryosurgery, to name a few, none are definitive in treatment. Understanding the molecular basis of keloids may lead to development of new therapies. Striae, also known as 'stretch marks', are extremely common, disfiguring and a real challenge to treat. Management of striae is a neglected field of research. Except for topical retinoids, the efficacy is satisfactory. Current treatment options include chemical peels, lasers and collagen induction therapy, with a tendency towards active intervention. However, studies are necessary to determine treatment strategies which produce results that are effective with minimal adverse effects. Post-acne scarring is one of the most common causes of facial scars, causing considerable cosmetic disability. Acne is a common skin disorder, unfortunately affecting a large number of teenagers. Usually patients have a combination of different types of scars; hence no single modality is useful. A combination of procedures is generally required for a satisfactory cosmetic outcome. The use of fractional lasers is gaining importance, as it is a minimally invasive procedure as compared to aggressive resurfacing procedures of the past. Collagen induction therapy is another promising technique. Today, patients are also getting up-to-date information about the various modalities available for scar treatment through media, such as magazines, advertisements and internet. However, exaggerated advertisements and information from nonprofessional sources, particularly with regard to lasers can influence patient expectations and result in unrealistic expectations. Patients need to understand that deep scars cannot be eliminated fully and can only be improved. They usually have high expectations from procedural techniques. Proper counseling

is extremely important for a happy and satisfactory outcome. Current innovations and techniques in scar prevention and management and increasing use of minimally invasive surgeries are paving the way toward smoother, less noticeable scars. Every surgeon practicing aesthetics should be well versed with modalities of scar management and this is the aim of this clinical update.

Body Contouring Oct 15 2021 As plastic surgeons, we seek to combine art and science to improve the results we see in clinical practice. Through our artistic sensibilities, we try to understand and obtain aesthetic results. Scientific analysis provides the data to predict which approaches will be successful and safe. Both art and science connote a high level of skill or mastery. At the present time, our literature is replete with descriptions of specific pro- dures

for body contouring. However, there remains a need for a definitive reference describing the basic principles to address the complete scope of body contouring including the postbariatric patient and their plastic surgery deformities. Dr. Shiffman and Dr. Di Giuseppe saw this need and sought to address the needs of plastic surgeons faced with the complexities of body contouring surgery. This is a comprehensive text aimed at providing multiple perspectives. The numerous sections, which include a- posity and lipolysis, the breast, abdomen, chest, and buttocks, the extremities, and liposuction, offer various approaches from the foremost authors. Indeed it is with a tremendous amount of skill and mastery that Dr. Shiffman and Dr. Di Giuseppe have successfully edited and collated the numerous contributions to this work. In addition, they have authored individually or, in collaboration, over a dozen of the 87 total chapters. Their combined work as editors and authors are e- dent throughout their text. The fnal result is a comprehensive contribution that will benefi all plastic surgeons seeking to improve their approach to body contouring.

Functional Atlas of the Human Fascial System Jan 26 2020
Principally based on dissections of hundreds of un-embalmed human cadavers over the past decade, *Functional Atlas of the Human Fascial System* presents a new vision of the human fascial system using anatomical and histological photographs along with microscopic analysis and biomechanical evaluation. Prof. Carla Stecco – orthopaedic surgeon and professor of anatomy and sport activities – brings together the research of a multi-specialist team of researchers and clinicians consisting of anatomists, biomechanical engineers, physiotherapists, osteopaths and plastic surgeons. In this Atlas Prof. Stecco presents for the first time a global view of fasciae and the actual connections that describe the myofascial kinetic chains. These descriptions help to explain how fascia plays a part in myofascial dysfunction and disease as well as how it may alter muscle function and disturb proprioceptive

input. Prof. Stecco also highlights the continuity of the fascial planes, explaining the function of the fasciae and their connection between muscles, nerves and blood vessels. This understanding will help guide the practitioner in selecting the proper technique for a specific fascial problem with a view to enhancing manual therapy methods. Functional Atlas of the Human Fascial System opens with the first chapter classifying connective tissue and explaining its composition in terms of percentages of fibres, cells and extracellular matrix. The second chapter goes on to describe the general characteristics of the superficial fascia from a macroscopic and microscopic point of view; while the third analyzes the deep fascia in the same manner. The subsequent five chapters describe the fasciae from a topographical perspective. In this part of the Atlas, common anatomical terminology is used throughout to refer to the various fasciae but it also stresses the continuity of fasciae between the different bodily regions. Over 300 unique photographs which show fascia on fresh (not embalmed) cadavers demonstrates the composition, form and function of the fascial system Highlights the role of the deep fascia for proprioception and peripheral motor coordination Companion website – www.atlasfascial.com – with videos showing how fascia connects with ligaments

The current trend is towards gentle surgical methods. The 'Mang School' has as its motto: Less is more! You should not see cosmetic surgery. The new edition bridges a few gaps, namely breast lifting and breast reduction. These operations are described in detail in order to provide also plastic and aesthetic surgeons with standards. Standards are of crucial importance in aesthetic surgery. Results must be reproducible. Every aesthetic surgeon will then be able to build on this manual and refine his or her methods.
